# WEEKLY HEALTH REPORT

## NATURE OF THE DATA

The data presented here are taken from the Statistical Reports, Forms 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

### MORBIDITY DATA

In this report admission rates are shown for all causes (disease and injury) combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per thousand strength as given in this report furnishes an approximation to the current non-effective rate. The mean number of non-effectives per thousand strength is given in the summary table for the total United States and for each of the Service Commands.

### STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having a strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

### HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), beds occupied and beds "available vacant." The number of beds "available vacant" is defined as 80% of the total bed capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total of the beds "available vacant" for only those stations in which 80% of the total bed capacity exceeds the beds occupied. Beds currently reported as "expansion beds" and beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in this report.

In the case of general hospitals there are shown, in addition, the number of Army patients admitted and disposed of during the week (by death, return to duty, transfer, or otherwise), the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, and corresponding data for battle casualties. Where the hospital has convalescent facilities, the letters (CF) appear after its name. The patients "otherwise" disposed of represent for the most part discharges on account of disability. In the case of Army battle casualties, all of which are currently admitted to general hospitals in this country as transfers, there is shown for each hospital the net number transferred during the week; i.e., admissions by transfer less dispositions by transfer. The total for the country as a whole represents the number of battle casualties evacuated to the United States from overseas theaters.

### EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where part or all of the current week's data for a particular station has not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

## COMMENT ON CURRENT TRENDS

### CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES AS A WHOLE

As indicated in the chart on page 3, the admission rates from all causes and from all diseases combined increased somewhat during the week ending 14 January 1944, even though the admission rate from colds, influenza, etc. was reported only fractionally higher than during the preceding week. This is the first increase in morbidity from all causes and from all diseases combined since the peak of the recent outbreak of respiratory infections registered during the week ending 11 December 1943. The all causes rate at 865 per thousand per year and the corresponding all diseases rate of nearly 800 per thousand per year were both about 15 percent lower than for the week ending 15 January 1943 at which time, however, admissions from respiratory causes were close to their highest for the early months of 1943.

The admission rate from colds, influenza, etc. for the week ending 14 January 1944 was reported at 353 per thousand per year or practically the same as for the preceding week. This was about 35 percent below the relatively high rate prevailing during the week ending 15 January 1943. Morbidity from all forms of pneumonia continued low, on about the same level as in recent weeks.

The admission rate from injury for the week ending 14 January 1944 was practically the same as during the preceding week, at the relatively low level of about 70 per thousand.

For the third successive week, the number of cases of measles, mumps, and scarlet fever (and especially the latter two) showed pronounced increases. The number of cases of meningitis declined somewhat as compared with the preceding week. On the other hand, the number of cases of rheumatic fever increased to the highest number reported in any week since June 1943.

### VARIATIONS IN MORBIDITY BY SERVICE COMMAND

Morbidity from all causes and from all diseases combined showed a very large increase in the Second Service Command, and substantial increases were also reported from the First, Sixth, and Seventh Service Commands. On the other hand, the Fifth, Eighth, and Ninth Service Commands reported lower morbidity from all causes and from disease.

The sharp increase in morbidity from all causes and from disease in the Second Service Command reflected an outbreak of food poisoning at Camp Kilmer (560 cases). The higher morbidity in the First, Sixth, and Seventh Service Commands was mainly due to higher admission rates from colds, influenza, etc.

The only Service Commands to report lower morbidity from colds, influenza, etc. were the Fourth and Eighth. Decreased morbidity from respiratory causes in the Eighth Service Command was responsible for the greater part of the decreases in its admission rates from all causes and from all diseases combined.

The highest rates of morbidity from all causes -- all in excess of 1000 per thousand per year -- were reported from the Seventh, Second, and Sixth Service Commands in that order. These Service Commands all reported morbidity from colds, influenza, etc. in excess of 400 per thousand per year. The lowest

# WEEKLY HEALTH REPORT

WEEK ENDING 14 JANUARY 1944

## COMMENT ON CURRENT TRENDS (CONT'D)

morbidity from all causes and from disease was registered in the Ninth Service Command, which was the only one to show morbidity from colds, influenza, etc. under 300 per thousand per year.

The Fourth and Eighth Service Commands continued to account for more than 60 percent of the total number of new cases of measles. The Fourth and Ninth Service Commands reported more than 50 percent of the total new cases of mumps. The number of new cases of scarlet fever increased most in the Seventh and Ninth Service Commands which between them accounted for nearly 50 percent of the total number of new cases in the country. The Seventh Service Command continued to report the largest number of new cases of rheumatic fever, but the greatest increase was in the Ninth Service Command.

### NON-EFFECTIVE RATE

The mean number of non-effectives for the country as a whole was reported at 40 per thousand for the week ending 14 January 1944 as against 38 per thousand during the preceding week.

The largest increases in the non-effective rate were reported from the Sixth, Seventh, Fifth, and Second Service Commands. In the Sixth and Seventh Service Commands these increases were in large part due to changed reporting by several general hospitals which had previously been reporting days lost incorrectly.

The differences in the non-effective rates by Service Command do not reflect so much the variations in morbidity in the Service Commands as the distribution of General Hospitals. When comparisons are made between the non-effective rates by Service Command excluding General Hospitals, the differences between the non-effective rates by Service Command are seen to be very much smaller than when the days lost in the General Hospitals are included.

### CURRENT HOSPITALIZATION CONDITIONS

The total bed capacity reported as of 14 January 1944 was nearly 368,000. This apparent increase in capacity of about 4,000 beds as compared with 7 January 1944 represents largely a change in the basis of reporting bed capacity and not an actual increase.

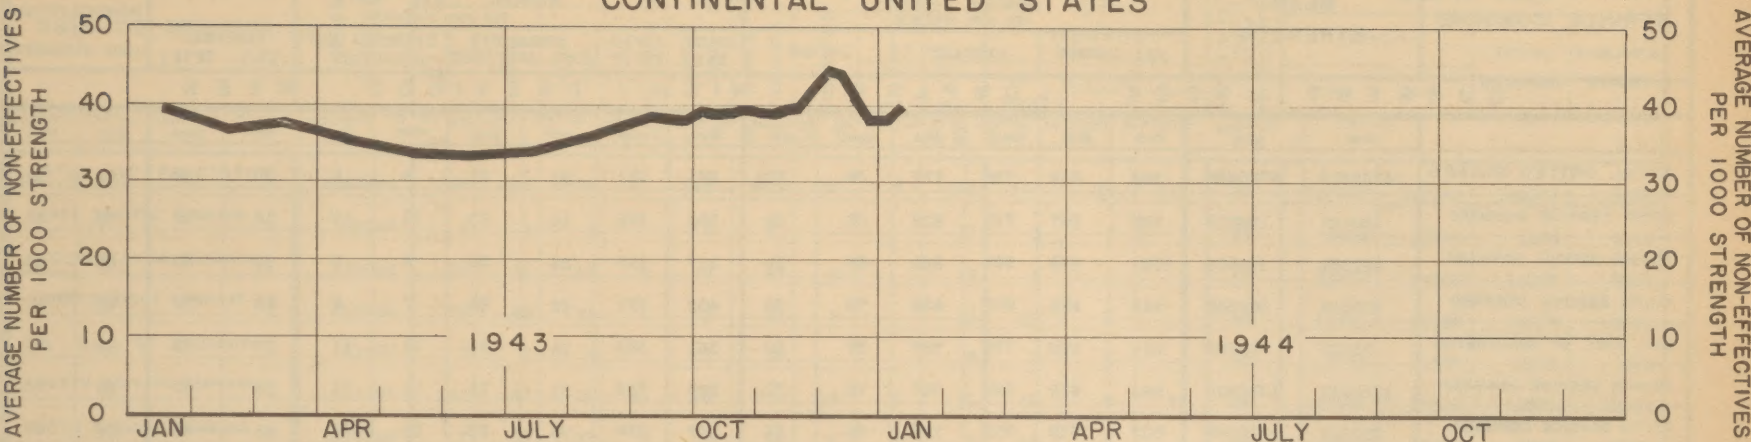

The number of beds occupied as of 14 January 1944 was about 182,000 or an increase of almost 6,000 over the previous week; at the same time the number of "available vacant" beds decreased to about 113,500. On 14 January there were 28 stations with a bed capacity of over 25,000 which had no "available vacant" beds; included among them were 5 general hospitals with a bed capacity of more than 8,000 beds.

On 14 January 1944 there were 2,183 cases of malaria remaining under treatment, all but 32 of which had presumably been acquired outside of the United States. The number of neuropsychiatric cases remaining under treatment at the end of the week was reported at 15,612, while the number of tuberculosis cases remaining totaled 1,041.

FOR THE FIVE WEEK PERIOD ENDING 31 DEC. 1943

## COMMENT ON INJURIES DATA

### PAST TRENDS IN MORBIDITY FOR THE CONTINENTAL UNITED STATES AS A WHOLE

As indicated in the upper portion of the chart on page 33 the annual rate of admission from injuries fluctuated within the relatively narrow limits of 110 to 130 per thousand strength during the peacetime years 1930-40. In 1941 when there was relatively much intensive training in our rapidly growing Army, the rate of admission from injury increased to almost 150 per thousand. In 1942 the rate of admission from injury showed a sharp decrease from the level prevailing during 1941 as a result of special efforts to reduce accidents by education, training, and use of safeguards. The provisional rate of admission for the entire year 1943 shows a further decrease.

As indicated in the lower portion of the chart on page 33, in only one month of 1943 has the admission rate exceeded 100 per thousand and for the five-week period ending 31 December was 66 per thousand, the lowest ever recorded for any month. This extremely low rate however reflects in part the slowing down of certain activities around Xmas time.

### CURRENT DATA FOR STATIONS WITH STRENGTH OF 5000 AND OVER

On pages 34 to 39 there are presented data on injuries for stations with a strength of 5000 and over for the five week period ending 31 December 1943. This data is provisional and may differ somewhat from the more complete figures to be presented in the full Supplemental Health Report for this period which will be included in next week's Weekly Health Report. All Service Commands reported very low admission rates from injuries with the highest rate (only 72 per thousand) being reported by the Fourth Service Command. Only seven individual stations reported injury admission rates in excess of 150 per thousand, namely Louisiana Maneuver Area, Laurinburg - Maxton AAB, N.C. (part of whose high rate was due to a nearby train accident which resulted in almost 50 deaths), Fort Eustis, Va., Camp Mackall, N.C., Fort Oglethorpe, Ga., Camp Fannin, Texas, and Camp Wallace, Texas.

The injury non-effective rate for the country as a whole was 7.7 per thousand which was about 20 percent of the total non-effective rate including both disease and injury admissions. This is in contrast with the fact that injury admission represented only about 7 percent of total admissions for December, thus indicating a longer duration for injury cases. Part of this difference arises from the high rate of admission during December for respiratory causes which in most instances had a duration of hospitalization of only a few days.

In considering the non-effective rate on account of injury for individual stations it should be kept in mind that in many cases the rates shown do not represent the entire time lost by individuals on account of injury since the individuals are not always completely treated at a particular station but are transferred to some other station or to a General Hospital. Likewise, the non-effective rates by Service Commands are not too significant because of the unequal distribution of General Hospitals as between the several Service Commands; thus for instance the high rates in the Military District of Washington and the Fifth Service Command arise because of this factor.

The total number of deaths on account of injury was about 725, representing an annual death rate of about 1.5 per thousand as compared with a death rate of less than .5 per thousand from disease. As in November a relatively large proportion of the deaths occurred at the stations of under 5,000 strength since this category includes many air fields. Of the total deaths, about 50 percent arose from airplane accidents, while about 25 percent were from automobile and truck accidents.

Studies made by the AAF have indicated that the admission rate from injury for the AAF is somewhat lower than for the remainder of the Army, whereas the death rate from injury is notably higher as evidenced by the relatively large proportion of the total injury deaths due to airplane accidents as indicated above. General analysis of the data in this report substantiates these conclusions. Thus the experience of life insurance companies has shown that for aviation risks the death rate from injuries is relatively high, while the incidence of disability from injuries is not abnormal.

### COMPARISONS WITH INDUSTRY

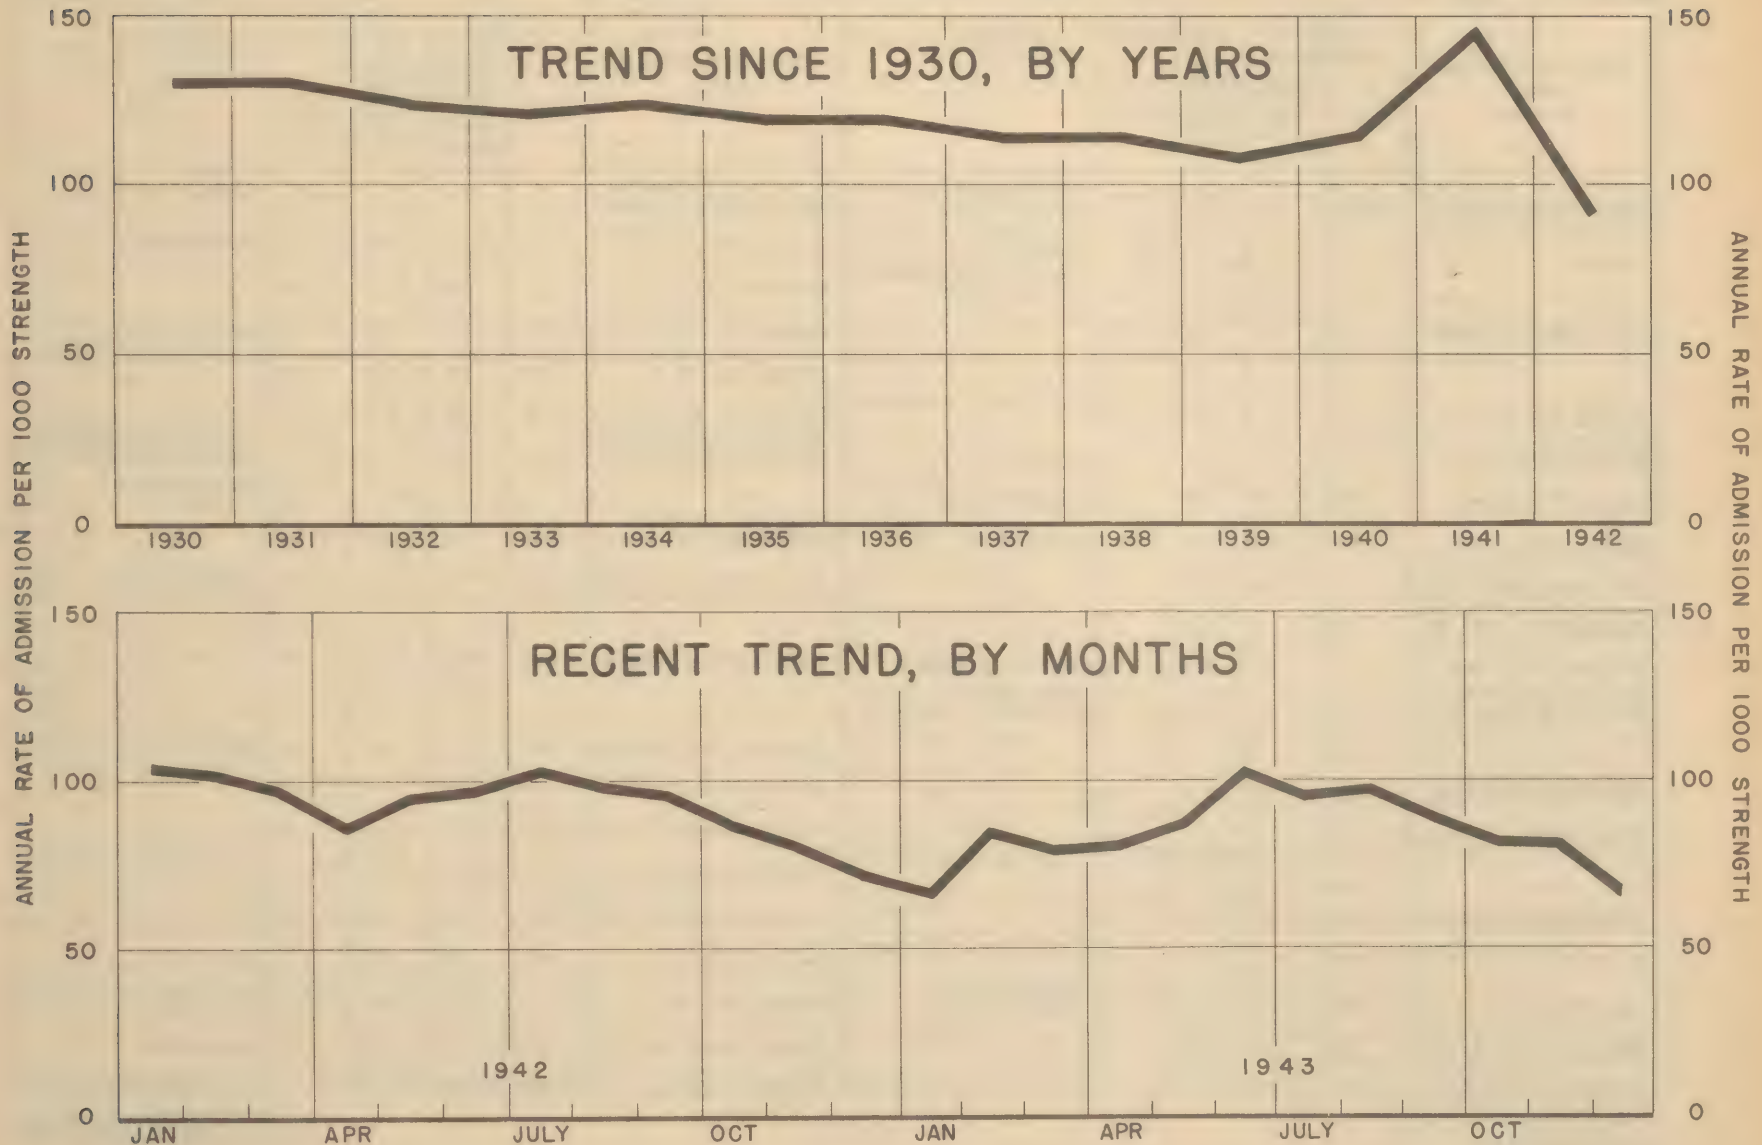

From data published by the National Safety Council in "Accident Facts" 1943 edition, it appears that an annual admission rate from injury of about 80 per thousand, such as that provisionally estimated for 1943 in Army stations in the continental United States is nearly twice as high as that of all the industries reporting in 1942 to the National Safety Council and corresponds closely to the 1942 rate for the marine industry.
